

1, Explain behaviour of hub device

* hub always send a data in broadcast level
hub is layer 1 device, It's occurs a collision
and traffic more then.

* hub send a data in all ports
only broadcast device.

2, Explain behaviour of switch device

⇒ Switch can create MAC table, there
will learn address of MACs.

⇒ Switch MAC table timing 5 minutes

⇒ Switch layer 2 device and it's intelligent

⇒ once MAC learn after find a saved mac
table to device into connect, collision & traffic also

⇒ There will be also broadcast & unicast ^{also occur}

3, Explain behaviour of router device

⇒ Router is a layer 3 device, It can
create a route table learn n/w ID and find a
route of all IP's segment, and it's traffic

distribution of IP's and it's can be only
route availability check after control traffic

⇒ Route table
